Version 8.5.1 Release Notes

Snow Commander® Release Notes for version 8.5.1 covers new features, upgrade notes, deprecated features, resolved issues, and known issues. Release notes for previous Commander versions are available at [Release Notes Archive](#).

What's New

Hyper-V SCVMM VM Networks

In Commander, you can now provision and configure SCVMM VMs with VM networks.

VM networks have replaced logical networks as the functional networks for SCVMM VMs. As a result, network zones are now assigned to VM networks instead of logical networks; this invalidates previously configured deployment destinations. To resolve this you will have to reconfigure existing SCVMM deployment destinations to use VM networks.

 **Note:** Service Portal doesn't support SCVMM VM network reconfiguration.

For more information, see [Networking and IP Management](#).

For new features in version 8.5, see [Version 8.5 Release Notes](#).

Upgrade Notes

You can upgrade to Commander version 8.5.1 from versions 8.0.x - 8.5.0. For more information, see [Upgrading Commander](#) in the [Installation Guide](#).

Before upgrading, it's recommended that you review all release notes between the version you're currently using and the version you're upgrading to. Release notes for previous Commander versions are available at [Release Notes Archive](#).

Upgrading to version 8.5.1 will affect the following:

- Costs from all regions are now displayed in the Cost Dashboards and Cloud Billing report, regardless of which regions are selected in the cloud account region selection.
- SCVMM VMs will be configured to use VM networks instead of logical networks.

Deprecations

There are no new deprecations for this hotfix release.

Resolved Issues

- **18657** Organization ownership now displays as expected on the approval landing page for change requests.
- **18571** OS Scan groups are no longer applied to assets by Policies in Commander. The Scanning Guest Operating Systems feature was removed as of version 8.4.
- **18543** Costs from all regions are now displayed in the Cost Dashboards and Cloud Billing report, regardless of which regions are selected in the cloud account region selection.

- **18513** You can now assign an approval email to an individual user who isn't part of an organization.
- **18466** Newly introduced regions will no longer impact the ability to retrieve billing data.
- **18429** The operating system list for Azure public images has been updated to include Windows 10, Windows 2019, and new Linux versions.
- **18357** Adding AWS cloud accounts with Assume Roles now works as expected.
- **18246** SCVMM is no longer disconnected when a VM's NIC is assigned multiple IP addresses.
- **18252** For Microsoft SCVMM cloud accounts, VMs deployed from a template will copy the SecureBoot configuration from the template.
- **18228** Optimized Commander memory usage for large environments.
- **16506** When a VM with a NIC that's assigned multiple IPs from an IP pool is deleted, the IPs are now either released as expected, or the IP conflicts are properly identified.

Known Issues

- **18887** Network configuration changes aren't supported when manually provisioning an SCVMM VM from another VM. This doesn't apply to templates. Any network adapters that are added or removed won't have the correct network assigned to the deployed VM.

For the complete list of known issues for 8.5.0, see [Version 8.5 Release Notes](#).
